

Comparison of Euclidean Buffer and Street Network Service Areas Relative to Middle Schools in Salem, Oregon

Cartographer: Joshua Mason

3 Miles

This map applies two different methods, a Euclidean distance buffer area of 1.5 miles, and a 4-minute street network service area to observe the spatial relationships between 10 middle schools in Salem, Oregon and the areas which surround them.

A Euclidean distance buffer measures the distance from a point, and creates a radius out from that point at your specified distance. This is an equal distance around the entire radius from the point.

A network service area differs from a Euclidean distance buffer because it considers the point, and addresses how capable different networks (often travel networks, roads, etc.) are at reaching that point within a specified time frame, in this case, four minutes.

Name	Acres
Leslie M.S.	2234.27417
