The Zigzag River HUC10 watershed is part of the Hydrologic Unit Code (HUC) system. This classification system divides different regions into watersheds which helps to provide important information about the geography, land use, ecology, and hydrology of the area. The Zigzag River watershed is located in Oregon, within the Mount Hood National Forest. The Zigzag River originates from the Zigzag Glacier near Mount Hood's peak. The Zigzag River flows westward and joins the Sandy River near Welches, OR. The area is known for its lush forests and heavy rainfall, providing an important habitat for species of fish like steelhead, salmon, and whitefish. I grew up in Zigzag, Oregon, where I spent most of my summers along the Sandy River, about 1 mile North of where the Sandy River meets the Zigzag River.

Line Features

Average Annual Flow in Cubic Feet per Second

- > 300,000 - 660,000
- 100,000 - 300,000
- 10,000 - 100,000
- 5,000 - 10,000
- 0 - 5,000

Other Linear Water Features

- Ephemeral/Intermittent
- Non-Network
- Pipeline

Area Features

- Complex Channel
- Submerged Stream
- Aqueduct
- Rapids
- Wetland
- Areas Subject to Flooding
- Dam
- Ice
- Playa or Wash
- Rivers and Streams
- Lakes, Ponds, Reservoirs, and Estuaries
- ZigZag River Watershed
