Legend

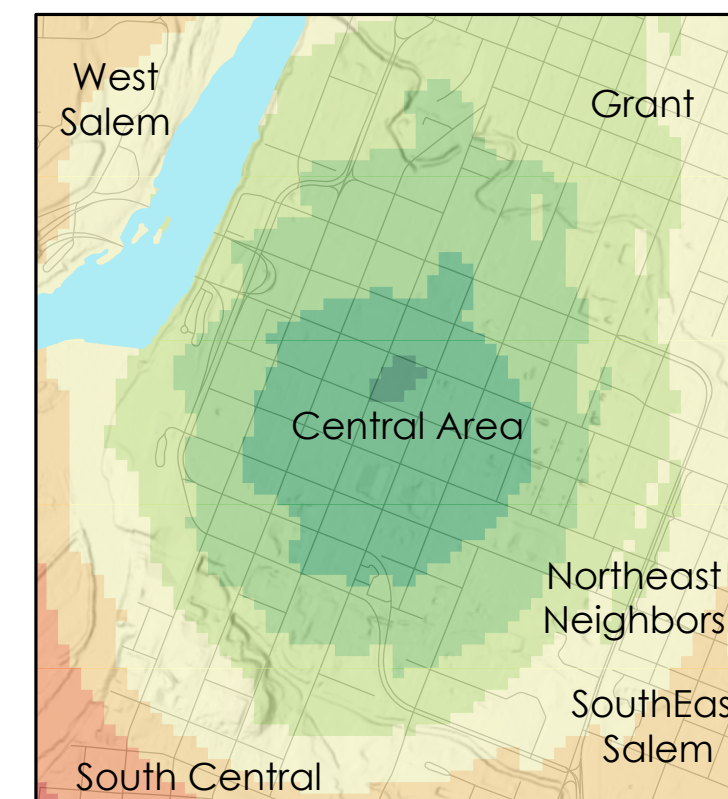

Bike Share Suitability

Low Suitability High Suitability

— Roads & Highways

— Rivers & Streams

The map and map extent pictured to the right depict a suitability analysis determining the most appropriate location for a new bike share infrastructure to be implemented in the city of Salem, Oregon. The suitability was determined based on three factors: pre-established transportation infrastructure, population density, and proximity to "Climate-Friendly Areas" (CFA's). CFA's are areas determined by the City of Salem and Oregon's Climate Friendly and Equitable Communities (CFEC) program. These areas are focused on reducing emissions and promoting more equitable infrastructure and planning. The gradient color scheme illustrates which areas in Salem are most suitable for implementing a new system of bike share infrastructures based on those factors. The analysis determined that the region encompassing Central Area in Salem is the ideal location for the new bike share system. Additionally, the map features names of the neighborhoods in Salem to provide extra context to what areas will be accessible from the bike share system.
